

Do You Have a Client that Lifts?

Tammy Taylor "No More PROBLEM Nails" Kit:

There is always the one client who has a hard time keeping her nails on, and they usually have "thin" nail-beds. When a client has a thin nail-bed the natural nail is very smooth and difficult to etch.

However, if we do not get a good etch on the natural nail, the nail enhancement "will" lift. Using your Tammy Taylor Etcher will help eliminate this; Nail preparation eliminates 75% of all "LIFTING" PROBLEMS.

And... with your Tammy Taylor "No More PROBLEM Nails" Kit, you will not have all the Lifting and the Repairs, so the PROBLEM nails will be easier and faster to do.

Tammy Taylor

Tammy Taylor "No More PROBLEM Nails" Kit:

Tammy Taylor Disposable 100-Grit Purple Terminator "Etcher"

- Acrylic will not adhere to a smooth or shiny surface. If the Natural Nail surface has any shiny spots there will be lifting.
- The Tammy Taylor 100-Grit Purple Terminator is the only abrasive I recommend for etching and prepping the natural nail before Acrylic application.
- Using the Tammy Taylor Disposable 100-Grit Purple Terminator "Etcher", Etch the way the nail grows; this creates little hills & valleys on the natural nail to create a rough, porous surface for the Acrylic Nail to adhere.
- Etching the way the natural nail grows with a Tammy Taylor Disposable 100-Grit Purple Terminator "Etcher" does not cause damage to the natural nail.
- **Warning:** Do Not Use a drill on a thin natural nail to etch; this will cause the natural nail to become even thinner and damaged; which causes more lifting. A drill should never be used to Etch the natural fingernail.
- Do Not Use an old, used file to etch or you will cause lifting.

Tammy Taylor
CEO, Tammy Taylor Nails

- The Tammy Taylor Disposable 100-Grit Purple Terminator "Etcher" works great because you use a brand new 100-Grit Purple Terminator "Etcher" Strip on each client; this insures excellent preparation to eliminate lifting, and it is very economical.

Tammy Taylor "NON-LIFTING NAIL PRIMER"

- Use your Tammy Taylor "NON-LIFTING NAIL PRIMER" with any brand of acrylic nail products, which you may presently be using.
- No other nail primer will give you better results, consistently and on every client.
- **Warning:** Do Not use any type of a pre-primer, nail fresh, pre-bond, nail prep or scrub for adhesion. Using any type of pre-prime or cleansers, especially anything with alcohol in it, can actually cause lifting, and cost you a lot of money, "time" and aggravation.
- Tammy Taylor "NON-LIFTING NAIL PRIMER" is still "**wet**" when acrylic is applied.
- Use 2 COATS of Tammy Taylor "NON-LIFTING NAIL PRIMER".
- Let the 1st COAT of Tammy Taylor "NON-LIFTING NAIL PRIMER" "**dry**". This will dry out the oils on the nail and kill the germs on the nail.
- The 2nd COAT of Tammy Taylor "NON-LIFTING NAIL PRIMER" needs to be applied one nail at a time; this will insure your nail primer is still "**wet**" when the "**wet**" acrylic is applied.

- The "**wet**" Tammy Taylor "NON-LIFTING NAIL PRIMER" and wet acrylic blend together, causing a chemical reaction, which pulls the product into the hills & valleys on the nails.

- **Note:** If the second coat of Tammy Taylor "NON-LIFTING NAIL PRIMER" dries before applying the acrylic, apply a third coat of primer.

Tammy Taylor "Primer Holder"

- Your Tammy Taylor "Primer Holder" is one of the most important nail investments you will ever make.

Warning: Nail primer is an acid and can cause burning if spilled on skin, so Do Not use nail primer without first placing it in your Tammy Taylor "Primer Holder".

Your Tammy Taylor "Primer Holder":

- Prevents dangerous primer spills
- The flexible rubber holds the bottle tightly, even when you tilt it
- Available in black, so it will not look dirty with years of use
- Eliminates Broken Primer bottles
- Makes it faster when doing nails because you can use one hand

Tammy Taylor "Plastic Manicure Brush"

- **Warning:** Do not use a cosmetic or fluffy brush to dust off the nails after etching, as this can spread germs, mold and fungus, as well as put dust and oil on the nail, which causes lifting.
- Always use a Tammy Taylor "Plastic Manicure Brush" to clean the nail dust off the nail after etching.
- After etching, there are white particles on the nail-plate. These white particles are dead skin and dirty nail.
- If these particles are not removed, they will clog the hills & valleys we created by etching.
- If these particles are not removed, the nail primer and the product will not flow properly, which will stop adhesion and cause lifting.
- **Helpful Pointers:**
- To eliminate Fill-LINES and a lot of extra work, try not to nip the acrylic back when doing a fill; just file the acrylic nail flush with the natural nail. But... if lifting occurs, you will need to nip, so moisture does not get trapped under the acrylic.
- **Do not use a pump for the nail liquid**, because it will not allow you to submerge your brush properly, and without the proper amount of liquid for good

product consistency, it can cause lifting. Also, pumps can cause liquid contamination, which causes lifting and yellowing.

- I know you will be impressed with the results from your **Tammy Taylor "No More PROBLEM Nails" Kit** especially when your Problem Nail Clients are thrilled when they DO NOT have lifting problems. And, you can use your **Tammy Taylor "No More PROBLEM Nails" Kit** with any brand of acrylic nail products, which you may presently be using.
