Two Most Common Nail Infections

Fresh Nail. Fast, effective remedy for the common bacterial infection of the nail plate, pseudomonas. This bacterial is caused by moisture being trapped between the top of the natural nail and the bottom of the artificial nail. Presents as a greenish black discoloration on the nail plate as the common name "the greenies" implies. After removing the artificial nail, apply Fresh Nail to the affected area with a towelette, or complete submersion for one minute. If condition persists, seek medical advice from a physician.

Size 4 oz. \$9.00

Thymolize Solution. Effective, broad spectrum anti-fungal for infections of the nail bed, at the hyponychium under the free-edge.

The problem usually presents by a lifting of the nail off the nail bed, creating the perfect condition for highly contagious fungus to grow. Remove artificial nails and apply Thymolize 3-5 times per day under the free edge, every day until the

nail reattaches. If the condition persists more than 7 days, consult a physician. Thymolize is a highly effective preventative treatment when wearing artificial nails, one application per day under the free edge for both fingernails and toenails. Professions that are exposed to conditions favorable to nail infections such as bartenders, day care staff, nurses, janitors and money handlers can use daily as a preventive anti-fungal treatment.
